Assignment: Mobile Application Project Planning Using Taiga

Name : Koushal Mandal
USN : 1RUA24BCA0044

Problem Statement : Many BCA departments manage student information and activities in a scattered or manual way, making data hard to access and update. Finding details about a specific student is time-consuming and inefficient. Students also lack a single platform to view their academic records and activity history. Communication between juniors and seniors is limited, reducing mentorship and guidance opportunities. This project proposes a centralized BCA Student App to search and view student profiles easily. It will allow students to access their own academic and activity details securely. It will also provide a platform for junior-senior interaction to support learning and collaboration.

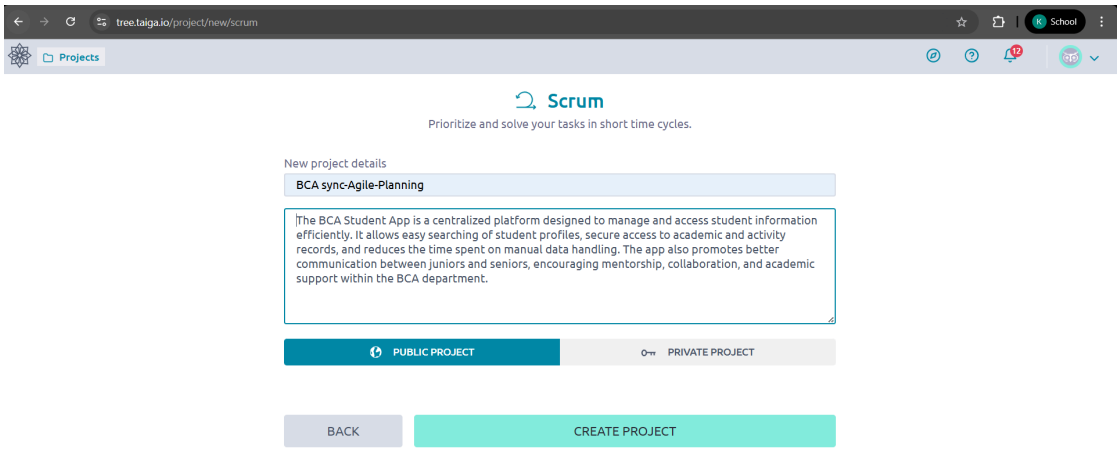
Target users :

- BCA Students
- Junior and Senior Students
- Department Staff (for reference access).

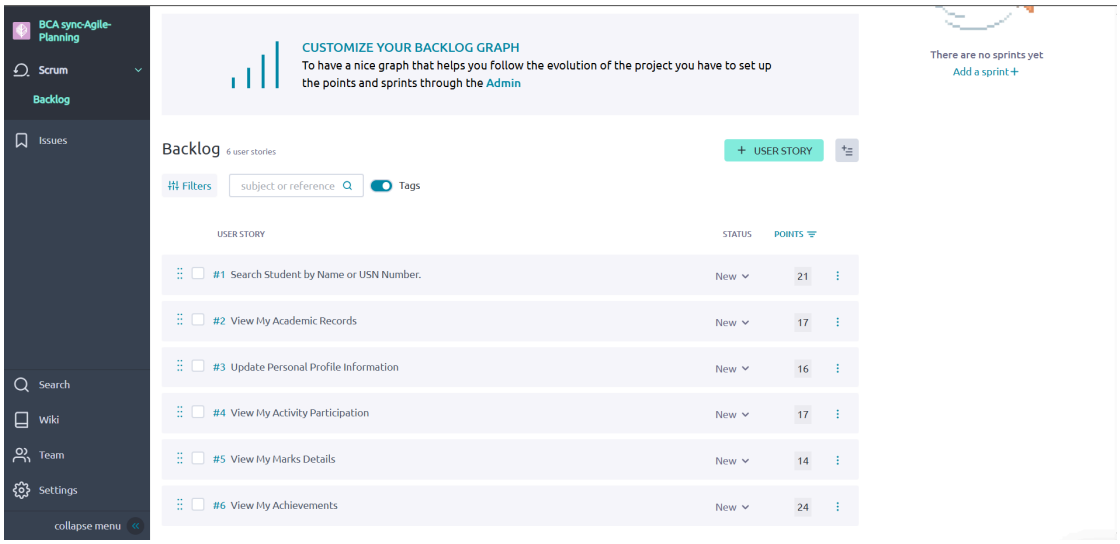
App Name : BCA SYNC

Platform : Android

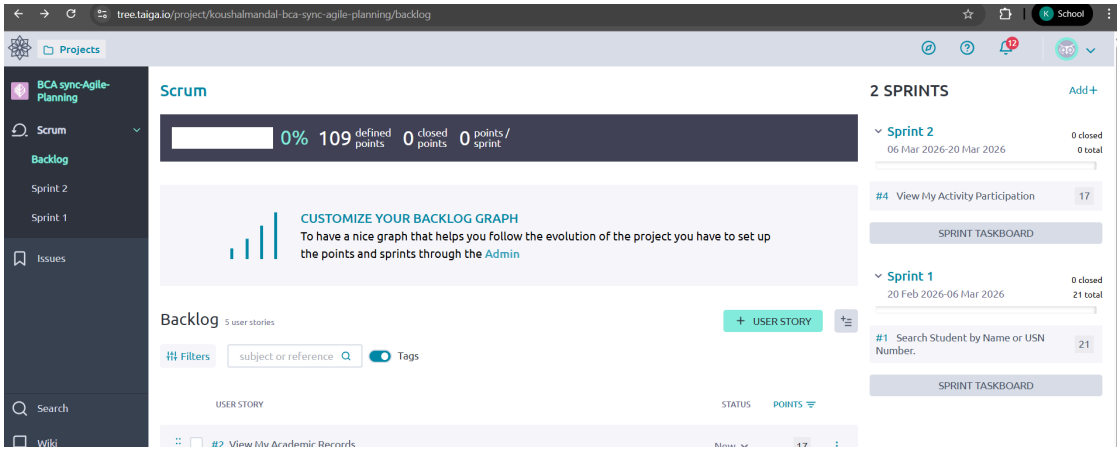
Step 2: Create Project in Taiga (1 Mark)



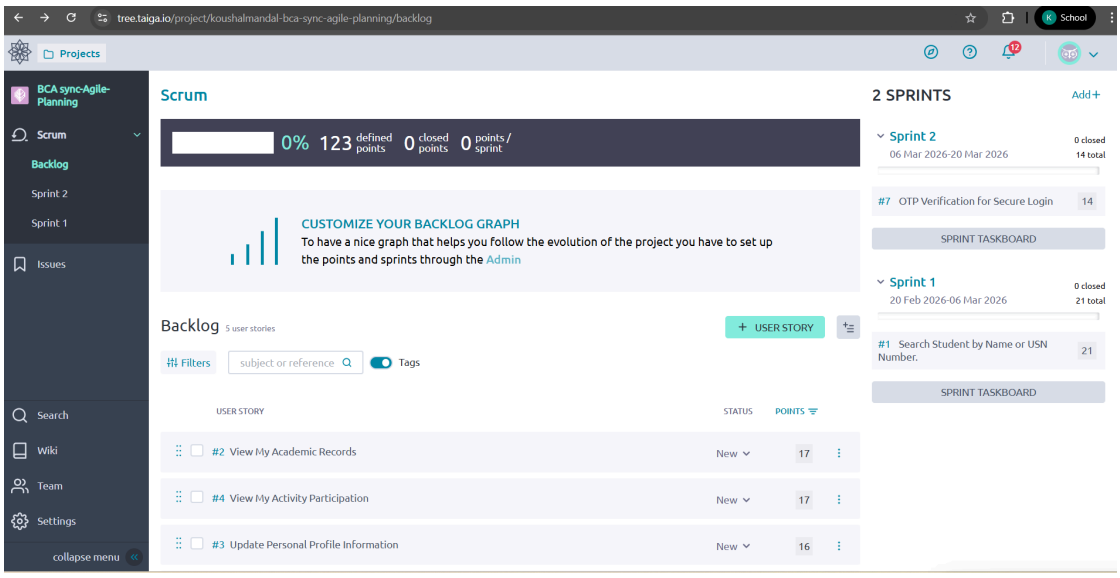
Step 3: Create Product Backlog (3 Marks)



Step 4: Sprint Planning (2 Marks)



Step 5: Change Simulation (1 Mark)



Step 6: Short Reflection (2 Marks)

Write 150–200 words answering:

1. Why is Agile suitable for your mobile app?

<u>Solution:</u> Agile is suitable for our BCA Student Mobile App because the requirements may change based on student and faculty feedback. Features like student search, marks viewing, and achievements tracking may need improvements over time. Agile allows development in small iterations (sprints), making it easier to test features step by step. It provides flexibility, faster delivery, and continuous improvement. This approach ensures the app becomes more efficient and user-friendly with every sprint.

2. How did Taiga help in planning?

<u>Solution:</u> Taiga helped in organizing the project effectively by managing the product backlog and sprint planning. It allowed us to create user stories, assign priorities, and estimate story points. We could divide work into tasks

such as UI development, backend logic, and testing. The sprint board made it easy to track progress and understand the workflow clearly.

3. What happens when requirements change?
Solution: When requirements change, Agile allows us to update the product backlog and reprioritize tasks. New features or modifications can be added to future sprints without disturbing completed work. This flexibility helps the team adapt easily to changes.

4. What was challenging while using Taiga?
Solution: One challenge while using Taiga was estimating story points accurately. It was sometimes difficult to decide task priorities and divide work properly. Understanding sprint management and backlog organization required practice.
